Weekly Assignment 5

Lesson 9 & 10
Due Date: Before Next Class(Saturday)

This assignment covers CSS Selectors, Positioning, and Modern Flexbox Layouts. You will practice applying targeted styling rules using combinators and pseudo-classes, control element positioning, and build responsive, dynamic UI components using modern Flexbox techniques.

Task 1: Interactive Navigation Bar with Dropdown

Build an interactive, sticky navigation bar featuring a dropdown menu using advanced CSS selectors and positioning:

- ➔ **Selectors & Combinators:** Utilize class vs ID selectors, descendant, and child combinators to precisely target navigation elements and submenus.
- ➔ **Interactive Pseudo-Classes:** Implement interactive feedback states using :hover, :active, and :focus on navigation links and dropdown triggers.
- ➔ **CSS Positioning & Z-Index:** Apply fixed or sticky positioning to lock the navbar to the top, and use relative/absolute positioning alongside z-index to manage dropdown stacking context.

Task 2: Responsive Pricing Cards Layout with Flexbox

Design a modern pricing table component leveraging Flexbox layout properties:

- ➔ **Flexbox Architecture:**
  - ◆ **Container Alignment & Spacing:** Establish a flexible layout using flex-direction, flex-wrap, justify-content, align-items, and gap for clean spacing.
  - ◆ **Sizing & Centering:** Control card dimensions using flex-grow, flex-shrink, and flex-basis, and utilize the Flexbox centering technique for internal card content.
  - ◆ **Nth-Child Styling:** Apply structural pseudo-classes like :nth-child to

highlight featured or recommended pricing plans dynamically.

Submission Instructions: Please submit your completed assignment files before the deadline. Good luck with your coding!

Have fun coding with Colors! (✿◡‿◡)
